TimeWise

What is TimeWise ?

- TimeWise is a calendar application aimed towards improving user productivity by offering unique features that streamline event planning, task management and record keeping.

- While the calendar appears at the forefront of the application, the core functionality will be the aspects that allow users to achieve peak organization.

At a glance…

- Improved calendar application to enhance user productivity
  - Streamline event planning, task management, and record keeping
- Calendar aspect is the focus
  - Core features surrounding the calendar allow for increased organization

- While we have features similar to the CANVAS calendar and other calendar applications, such as planning tasks, meetings, and reminders, we also have other features that aim to make us stand out.

- We mainly want to improve the experience for students and professors who have dealt with the shortcomings of CANVAS calendar for years, while also making it applicable to professionals and everyday users.

What we do differently

- One-page application
  - Features are apparent and easily accessible
  - Small learning curve for new users
  - Experienced users can take advantage of minimal effort required to plan items

- Overall, developing a one-page application will allow for all features to be apparent and easily accessible, establishing a minimal learning curve for new users and allow ease of transition of existing users on other applications, such as CANVAS calendar.

What we do differently

- Prioritization badges:
  - Label items with priority to identify those with more importance
- Drag-and-drop:
  - Newly created items can easily be tracked and slotted into the calendar

What we do differently

- Task summary:
  - A daily pop-up providing the user with a summary of what is to be done on that day
- Notes/journal entries
  - Unique functionality of having documents as an item that can be added

What we do differently

- Top 50 items displayed for the calendar month
- Filtering based on:
  - Tags set by the user
  - Type of event
- Current day items sorted by priority and displayed in a concise manner

- Having unique aspects such as item prioritization "badges", drag-and-drop functionality directly into the calendar, daily task summaries, and the ability to add notes/journal entries, allow for an augmented planning capability as compared to competitors.

Why we developed this application

- As students that use CANVAS calendar, we felt that the options available were lacking.

- We decided to create this calendar application where the options available are simply more abundant and accessible.

- While CANVAS calendar provides adequate functionality, we aim to redesign this model by providing easier access to planning processes with a wider range of options all consolidated into a simple, user-friendly space.

- The entire application is built around improving the user's day-to-day life.
- Improved planning and task management can potentially lead to more free time, more time to perform on required tasks and less headache worrying about if there's enough time in the day to do something.
- From students to working professionals, the app can touch upon the daily lives of everyone

Optional Features

- If given more time, we would like to implement the following features:
- Integration and sign in capabilities from CANVAS to be able to transfer your planners
- Allowing users to share and collaborate with other users
  - Use cases: sharing schedules for meeting planning in a professional setting, collaboration on notes for students in class or even meeting notes for professionals.
- Progress bar for events with specific beginning and end dates
  - Track completion for events
- Search functionality to quickly locate specific items
- Theme functionality
